VALIDATION

CHECK	TARGET	RESULT	STATUS
Fits in GPU memory	384 GB usable	**365 GB needed**	PASS
Headroom	5% free	**19.3 GB free (5%)**	PASS
Context for chat	16K or more	**44K**	PASS
Writing speed	15 tok/s or more	**76 tok/s**	PASS
First reply	under 3 s, 2K prompt	**0.5 s**	PASS

Targets: a reply you can read along with, a first reply the use case tolerates, and 5% of memory left free. Calculated from published specs, not benchmarked.

BUDGET

HARDWARE, ONE-TIME	MSRP not entered
POWER, PER YEAR	$399 · 1520 W at the wall
CLOUD INSTEAD, PER YEAR	$6,887
3-YEAR TOTAL, OWNED	Hardware + $1,198 power

METHOD AND ASSUMPTIONS

Memory is the weights (parameters times bits per weight, read from each model's config.json), the context cache for every chat, and the runtime, against the memory this GPU can use after the OS and display take theirs. Writing speed is memory bandwidth over the bytes read per token, plus a per-layer latency, calibrated against llama.cpp benchmarks. First reply is the prompt's FLOPs over the chip's dense 16-bit TFLOPS at the runtime's measured efficiency. Running cost is power at the wall at your rate and hours; the cloud figure is the cheapest RunPod on-demand GPU that runs the same job. Accuracy: memory lands within about a gigabyte; speeds and times are rough, about ±25%. Model data and hardware specs checked Nov 2026; cloud prices are RunPod's on-demand list as of Nov 22, 2026.
